**Description****Background of the invention**5 **Field of the Invention:**

[0001] The present invention relates to methods for preventing, inhibiting or treating graft-versus-host disease (GVHD) and graft rejection reactions in organ transplantation.

10 **Prior Art:**

[0002] In bone marrow transplantation or blood transfusion, or organ transplantation from a donor to a recipient having no histocompatibility with the donor, the donor's lymphocytes migrate into the recipient. If the recipient cannot reject the donor's lymphocytes, the donor's lymphocytes take and proliferate in the recipient's body. Then the lymphocytes attack tissues with the guidance of antigens carried exclusively by the recipient, thus inducing disorders.

[0003] In 1959, Mathe et al. reported for the first time graft-versus-host disease (GVHD) in a leukemic patient after having bone marrow transplantation. The major symptoms of GVHD include frequent fever, anemia, diarrhea, vomiting, anorexia, abdominal pain and hepatopathy. GVHD breaks out in patients having non-autogenous myeloma cells and induces in some cases lethal diseases such as systemic erythroderma or hepatic insufficiency. When an immunodeficient patient has the transplantation of an organ which is rich in immunocompetent cells, there arises a high risk of the onset of graft-versus-host reactions. Therefore, it is an important problem to prevent and treat GVHD in infants or children who suffer from primary immunodeficiency and are going to have bone marrow transplantation for reconstructing the immune system or patients who are going to have bone marrow transplantation for treating malignant diseases.

[0004] Bone marrow transplantation is a therapeutic which comprises breaking a host's hemic system and transplanting the bone marrow, i.e., a mass of cells serving as the basis of the hemic system of a healthy donor to the host so as to reconstruct in the host's body a hemic system originating in the donor. Essential factors for the success in marrow transplantation include the take of a graft, the regulation of graft-versus-host reactions and the immunological reconstruction. About one week after the bone marrow transplantation, the leukocyte count of the host attains the minimum level and thus the host is liable to suffer from bacterial or fungal infection. Acute GVHD frequently breaks out at this stage. To prevent GVHD, it is a practice to give an immunosuppressant cyclosporin A (CsA) optionally together with, for a short period of time, methotrexate (MTX). At the onset of acute GVHD, prednisolone and cyclosporin A are administered. The treatment of acute GVHD with the use of these drugs is restricted due to the side effects thereof, for example, hypertension, renal function disorder and an increase in the recurrence rate of leukemia. Namely, it is believed that cyclosporin A relates to the onset of nephrotoxicity, bone marrow depression, hypertension, hemolytic-uremic syndrome, hyperglycemia, shock, hypomagnesemia, and, in particular, atherosclerosis in heart transplantation. Also, it is known that prednisolone relates to induced infectious diseases, peptic ulcer, etc., while methotrexate relates to bone marrow depression, hepatic/renal function disorder, mucosal disorder, psychoneurosis, interstitial pneumonia, pulmonary fibrosis, etc.

[0005] On the other hand, chronic GVHD breaks out 70 to 400 days after transplantation. It is classified into three types of 1) progressive onset following acute GVHD, 2) quiescent occurring once acute GVHD disappears, and 3) de novo newly occurring without the onset of acute GVHD. Compared with acute GVHD, chronic GVHD causes organ derangement over a broad range and thus induces the appearance of autoantibodies in many cases. Although it has been a practice to administer cyclosporin A and prednisolone to treat chronic GVHD, which is known to be observed in 30 to 60 % of patients with bone marrow transplantation, no satisfactory effect can be achieved thereby.

[0006] Under these circumstances, it has been urgently required to develop remedies for GVHD which are highly efficacious against acute GVHD and chronic GVHD and have a high safety.

[0007] The first case of organ transplantation was renal transplantation effected in 1950's. About 30 renal transplants were performed in USA, France, etc. till 1960. In those days, exposure of patients to radiation was the only method for inhibiting the graft rejection reactions (immune suppression). Thus, the rejection reactions could not be controlled well, which made it impossible to successfully perform the transplantation. The only successful case of renal transplantation was one effected between identical twins where no rejection reaction arose. Subsequently there have been developed immunosuppressants such as azathioprine, prednisolone, cyclosporin A, methotrexate and tacrolimus (FK 506). In organ transplantation, in particular, the appearance of cyclosporin A results in a remarkable increase in the ratio of successful transplants. However, the long-term administration of the immunosuppressants brings about various side effects and complications, which makes the postoperative QOL not always favorable. It is reported that the side effects of azathioprine include bone marrow depression, hepatic disorder, pancreatitis, digestive tract symptoms, cardiopalmus and respiratory disorder, while those of tacrolimus (FX 506) include renal function disorder, shock, elevation of blood pressure, heart failure, pancreatitis, hemolytic-uremic syndrome, thrombotic thrombopenia, purpura and

hyperglycemia. Also, prednisolone, cyclosporin A and methotrexate exhibit similar side effects as those described above.

[0008] Retinoic acid plays important roles in the growth and retention of functions in animals, for example, specifically regulating the differentiation and proliferation of cells and participating in the morphogenesis of vertebrates. Concerning these physiological functions, retinoic acid has attracted public attention as a carcinostatic or a specific remedy for proliferative skin diseases (psoriasis, keratosis, etc.). Thus, there have been synthesized a number of retinoic acid analogs. Recently, there has been pointed out the presence of more than one retinoic acid receptor subtype, though the physiological meaning thereof has never been clarified so far (The Retinoids, 2nd ed., Raven Press, Ltd., New York, 1994, Sporn, M.B., Roberts, A.B., Goodman, D.S.).

[0009] On the other hand, it has been known for a long time that vitamin A closely relates to the immune system. It has been frequently reported that retinoic acid, which is an oxidative metabolite of vitamin A, would exert a suppressive effect on the immune system. For example, Brinckerhoff et al. reported that secondary inflammation in rat adjuvant arthritis was significantly suppressed by administering 13-cis-retinoic acid (Science 221, 756, 1983.). Recently, Kuwabara et al. reported that rat collagen arthritis was significantly ameliorated and the blood anticolon collagen antibody titer was lowered by administering retinoic acid receptor- $\alpha$  agonists (FEBS Letters, 378, 153, 1996.).

[0010] It has been disclosed hitherto that retinoic acid receptor agonists are usable in treating cancers such as leukemia, mammary cancer, prostatic cancer, lung cancer, esophageal and respiratory tract cancer, skin cancer and bladder cancer, skin diseases such as psoriasis, keratosis, eczema, atopic dermatitis, acne and Darier's disease, autoimmune diseases such as rheumatoid arthritis and lupus erythematosus, inflammations in organs over a broad range such as chronic polyarthritis, spondylarthritis and arthrosis deformans, and allergic or rheumatic immunological diseases, in US 4703110, JP-A-2-76862, JP-A-63-255277, JP-A-8-505359, etc. However, there has been no report suggesting that retinoic acid receptor agonists are applicable to GVHD in bone marrow transplantation or retinoic acid receptor agonists inhibit graft rejection reactions in organ transplantation.

## 25 Disclosure of the invention

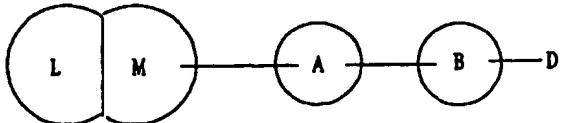

[0011] Under these circumstances, the present inventors have conducted extensive studies on the immunosuppressive effects of retinoic acid receptor (RAR) agonists. As a result, they have found out that retinoic acid receptor (RAR) agonists as will be shown hereinbelow, in particular, RAR $\alpha$  agonists have GVHD inhibitory effects and inhibit graft rejection reactions in organ plantation, thus completing the present invention.

[0012] Accordingly, the present invention relates to methods for preventing, inhibiting or treating graft-versus-host disease or graft rejection reactions in organ transplantation by administering an efficacious amount of retinoic acid receptor (RAR) agonists to patients.

[0013] The present invention further relates to the use of retinoic acid receptor (RAR) agonists in the production of drugs for preventing, inhibiting or treating graft-versus-host disease or graft rejection reactions in organ transplantation.

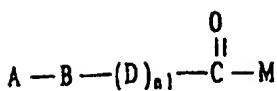

[0014] The present invention furthermore relates to drugs for preventing, inhibiting or treating graft-versus-host disease or graft rejection reactions in organ transplantation which contain retinoic acid receptor (RAR) agonists as an active ingredient.

Fig. 2 shows the effect of the compound A on chronic GVHD.

45

Examples

[0040] To illustrate the effects of the present invention, the following Examples will be given, though the present invention is not restricted to these compounds.

[0041] A graft-versus-host disease (GVHD) model experiment was effected in accordance with the method reported by Durei et al. (J. Clin. Invest., 94, 1333 1994.)

[0042] As the indication of an acute GVHD model (1), use was made of the cytotoxic T cell activity of a donor on a host. As the indication of a chronic GVHD model (2), use was made of the blood antiDNA antibody titer.

55

## Example 1

## Acute GVHD model:

5 [0043] In the transplantation, BDF1 mice (H-2b/d) and C57BL/6N mice (H-2b) were employed respectively as the hosts and donors.  $5 \times 10^7$ /mouse of donors' spleen cells were transferred into the hosts via the tail vein. 4-[2-[5-(4,7-Dimethylbenzofuran-2-yl)pyrrolyl]]benzoic acid (compound A) was suspended in a 0.5 % aqueous solution of methylcellulose and then orally administered to the hosts once a day from the first day of the cell transfer to the day before the measurement of the cytotoxic T cell activity. The 0.5 % aqueous solution of methylcellulose alone was similarly administered to the control group. 12 to 13 days after the cell transfer, the spleen of each host animal was taken out and a suspension of the spleen cells to be used as effector cells was prepared. As the target cells, use was made of P-815(H-2d) which were cultured together with the effector cells for 4 hours. The cytotoxicity (%) was expressed as the percentage of  $^{51}\text{Cr}$  liberated into the culture supernatant during this culture time to the total radioactivity.

10 [0044] Fig. 1 shows the results.

15 [0045] Thus, 4-[2-[5-(4,7-dimethylbenzofuran-2-yl)pyrrolyl]]benzoic acid (compound A) strongly inhibited the induction of the cytotoxic T cell activity dose-dependently from 0.1 mg/kg.

## Example 2

## Chronic GVHD:

20 [0046] In the transplantation, BDF1 mice (H-2b/d) and DBA/2 mice (H-2d) were employed respectively as the hosts and donors.  $5 \times 10^7$ /mouse of donors' spleen cells were transferred into the hosts via the tail vein. 4-[2-[5-(4,7-Dimethylbenzofuran-2-yl)pyrrolyl]]benzoic acid was dissolved in a 0.5 % aqueous solution of methylcellulose and then orally administered to the hosts once a day from the first day of the cell transfer to the day before the blood sampling. The 0.5 % aqueous solution of methylcellulose alone was similarly administered to the control group. Two weeks after the cell transfer, the blood of each host animal was sampled and the serum antiDNA antibody titer (IgG class) was measured by the ELISA method.

25 [0047] Fig. 2 shows the results.

30 [0048] Thus, 4-[2-[5-(4,7-dimethylbenzofuran-2-yl)pyrrolyl]]benzoic acid strongly inhibited the serum antiDNA antibody titer dose-dependently from 0.3 mg/kg.

After stirring at 0 °C for 30 min, a saturated aqueous solution of ammonium chloride and water were successively added to the mixture. The resulting precipitate was collected by filtration, washed with water and dried to give an alcohol (23.7 g). In a nitrogen atmosphere, the alcohol (23.7 g) was dissolved in N,N-dimethylformamide (60 ml) and phosphorus oxychloride (25 ml) was added dropwise to the mixture at 0 °C. After the completion of the addition, the reaction mixture was heated under stirring at 100 °C for 2 hr. Then it was cooled to room temperature by allowing to stand. Next, ice-water and sodium acetate (9 g) were added thereto followed by extraction with hexane (200 ml x 4). The organic layers were combined, washed with brine and dried over anhydrous magnesium sulfate. After filtering, the filtrate was concentrated to give an aldehyde (21.3 g) as a crude product.

[0056] In a nitrogen atmosphere, the obtained aldehyde (20.9 g) was dissolved in dioxane (300 ml). After adding dichlorodicyanobenzoquinone (50.9 g), the resultant mixture was heated under reflux for 1.5 hr. Then, it was cooled to room temperature by allowing to stand followed by the addition of toluene (500 ml). The resulting precipitate was collected by filtration and washed with toluene several times. The filtrate was concentrated and the resulting crude product was purified by silica gel column chromatography to give 5,8-dimethyl-2-naphthaldehyde (10.3 g) as colorless crystals.

<sup>30</sup>  $^1\text{H-NMR}(\text{CDCl}_3, 400\text{MHz}) \delta$  ; 2.69(s,3H), 2.76(s,3H), 7.31(d,1H,J=7.2Hz), 7.37(d,1H,J=7.2Hz), 7.99(dd,1H,J=1.6,8.8Hz), 8.11(d,1H,J=8.4Hz), 8.51(d,1H,J=1.6Hz), 10.2(s,1H)

[0057] 5,8-Dimethyl-2-naphthaldehyde (3.7 g) was dissolved in ether (80 ml). Then a 1.0 M solution (30 ml) of vinylmagnesium bromide in tetrahydrofuran was added to the mixture at - 78 °C and the resultant mixture was slowly heated to - 30 °C. After quenching with a saturated aqueous solution of ammonium chloride, the mixture was extracted with ethyl acetate (100 ml x 2). The organic layers were combined, washed with brine and dried over anhydrous magnesium sulfate. After filtering, the filtrate was concentrated to give allyl alcohol (5.0 g) as a crude product.

[0058] Then the allyl alcohol was dissolved in dichloromethane (30 ml). After adding activated manganese dioxide (30 g), the resultant mixture was stirred at room temperature for 40 hr. Then it was filtered through celite and the filtrate was concentrated. The resulting product was purified by silica gel column chromatography to give the title compound (1.8 g). At the same time, 1.2 g of the starting material was recovered.

The resulting crystals were filtered, washed with ethanol and then dried to give the title compound (1.26 g) as colorless crystals.

(Process 2)

[0060] A mixture comprising 5,8-dimethyl-2-naphthaldehyde (1.0g), methyl 4-acryloylbenzoate (1.2 g), 3-benzyl-5-(2-hydroxymethyl)-4-methylthiazolium chloride (0.28 g), triethylamine (0.88 ml) and N,N-dimethylformamide (20 ml) was

heated under stirring at 70 °C for 3 hr. After cooling to room temperature by allowing to stand, water was added to the reaction mixture followed by extraction with ethyl acetate (20 ml x 3). The organic layers were combined, washed with brine and dried over anhydrous magnesium sulfate. After filtering, the filtrate was concentrated and the resulting crude crystals were washed with a solvent mixture of n-hexane and ethyl acetate to give the title compound (0.82 g) as colorless crystals.

After evaporating the solvent,

the residue was purified by silica gel column chromatography to give an ether (18 g) as a colorless oil.

[0097] The resulting product was then dissolved in toluene (100 ml). After adding polyphosphoric acid (50 g), the resultant mixture was heated to 90 °C under stirring for 1 hr in a nitrogen atmosphere. After cooling to room temperature by allowing to stand, the liquid reaction mixture was poured into ice-water and extracted with ethyl acetate. The organic layer was washed with brine and dried over anhydrous magnesium sulfate. After evaporating the solvent, the resulting residue was purified by silica gel column chromatography to give 4,7-dimethylbenzofuran (3.5 g) as a yellow oil.

[0098] In a nitrogen atmosphere, n-butyllithium (1.56 M hexane solution, 18.4 ml) was added at -35 °C to a solution (50 ml) of the 4,7-dimethylbenzofuran (3.5 g) in dry tetrahydrofuran. Then the resulting mixture was stirred for 15 min and N,N-dimethylformamide (5.6 ml) was added dropwise to the mixture. Next, the reaction mixture was heated to room temperature and ethyl acetate was added to the mixture. The organic layer was washed with brine and dried over anhydrous magnesium sulfate. After evaporating the solvent, the resulting crude crystals were washed with n-hexane to give 4,7-dimethylbenzofuran-2-carbaldehyde (2.3 g) as a pale yellow solid.

4-[2-(5-(4,7-Difluorobenzofuran-2-yl)pyrrolyl]benzoic acid

55    [0115] 2,5-Difluorophenol (10 g) was dissolved in dimethylformaldehyde (120 ml). At room temperature, potassium carbonate (21 g) and allyl bromide (8.57 ml) were successively added to the mixture and it was stirred at 80 °C for 1 hr. After adding water to the liquid reaction mixture, it was extracted with ethyl acetate. The organic layer was washed with brine, dried over anhydrous magnesium sulfate and then concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (developing solvent: 5 % ethyl acetate/n-hexane) to give 2,5-difluor-

ophenol allyl ether (13 g) as a colorless oil.

<sup>1</sup>H-NMR(CDCl<sub>3</sub>,400MHz) δ : 4.58(d,2H,J=5.2Hz), 5.33(dd,1H,J=2.4,8.4Hz), 5.44(dd,1H,d,J=2.4,17.2Hz), 5.98-6.10(m,1H), 6.55-6.60(m,1H), 6.70(ddd,1H,J=3.2,6.8,10.0Hz), 7.01(ddd,1H,J=5.2,8.8,10.0Hz)

[0116] The 2,5-difluorophenol allyl ether (13 g) was dissolved in N,N-dimethylaniline (90 ml) and the resulting solution was stirred under a nitrogen gas stream at 170 °C for 5 hr. Then the liquid reaction mixture was poured into a 10 % aqueous solution of hydrogen chloride and extracted with ethyl acetate. The organic layer was washed with brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (developing solvent: 7 % ethyl acetate/n-hexane) to give 2-allyl-3,6-difluorophenol (7.8 g) as a colorless oil.

<sup>1</sup>H-NMR(CDCl<sub>3</sub>,400MHz) δ : 3.44(dd,2H,J=1.2,6.0Hz), 5.05-5.09(m,1H), 5.26-5.28(m,1H), 5.90-5.99(m,1H), 6.56(dt,1H,J=4.4,9.2Hz), 6.91(dt,1H,J=5.2,9.2Hz)

[0117] The 2-allyl-3,6-difluorophenol (7.0 g) was dissolved in dichloromethane (100 ml). After adding 3-chloroperbenzoic acid under a nitrogen gas stream at 0 °C, the resultant mixture was stirred at room temperature for 2 hr. After adding water to the liquid reaction mixture, it was extracted with dichloromethane. The organic layer was washed successively with a saturated aqueous solution of sodium bicarbonate and brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure to give an epoxide (7.2 g) as a crude product. The thus obtained epoxide (7.2 g) was dissolved in dimethyl sulfoxide (30 ml) and water (10 ml). After adding potassium hydroxide at room temperature, the resultant mixture was stirred for 4 hr. Next, ethyl acetate was added to the reaction mixture and the organic layer was washed with brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (developing solvent: 20 % ethyl acetate/n-hexane) to give fluoro-2,3-dihydro-2-hydroxymethylbenzofuran (1.2 g) as a colorless oil.

<sup>1</sup>H-NMR(CDCl<sub>3</sub>,400MHz) δ : 3.25(dd,1H,J=6.7,16Hz), 3.33(dd,1H,J=8.0,16.0Hz), 3.75-3.83(m,1H), 3.90-3.97(m,1H), 5.04-5.13(m,1H), 6.49(ddd,1H,J=2.8,10.0,11.2Hz), 6.87(dt,1H,J=4.4,10.0Hz)

[0118] The 4,7-difluoro-2,3-dihydro-2-hydroxymethylbenzofuran (1.2 g) was dissolved in pyridine (6 ml). After adding acetic anhydride (0.73 ml) under a nitrogen gas stream at 0 °C, the resultant mixture was stirred at room temperature for 17 hr. Then the liquid reaction mixture was poured into a 10 % aqueous solution of hydrogen chloride and extracted with ethyl acetate. The organic layer was washed with brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (developing solvent: 5 % ethyl acetate/n-hexane) to give 2-acetoxymethyl-4,7-difluoro-2,3-dihydrobenzofuran (750 mg) as a colorless oil.

<sup>1</sup>H-NMR(CDCl<sub>3</sub>,400MHz) δ : 2.17(s,3H), 3.08(dd,1H,J=7.2,15.6Hz), 3.39(dd,1H,J=10.0,15.6Hz), 4.28(dd,1H,J=6.4,12Hz), 4.36(dd,1H,J=3.6,12Hz), 5.13-5.20(m,1H), 6.51(ddd,1H,J=2.8,10.0,10.8Hz), 6.89(dt,1H,J=4.4,10.0Hz)

[0119] The 2-acetoxymethyl-4,7-difluoro-2,3-dihydrobenzofuran (750 mg) was dissolved in carbon tetrachloride (15 ml). After successively adding N-bromosuccinimide (582 mg) and azodiisopropylnitrile (10 mg) at room temperature, the resultant mixture was heated under reflux for 1 hr. Then the liquid reaction mixture was filtered through a glass filter and the filtrate was concentrated. To the resulting oil was added ethyl acetate. Next, the organic layer was washed with brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure to give a bromide (800 mg) as a crude product. This bromide was dissolved in tert-butyl alcohol (6 ml). Under a nitrogen gas stream, potassium tert-butoxide (a 1.0 M solution in tert-butyl alcohol, 3.3 ml) was added to the mixture at room temperature and the resultant mixture was stirred at room temperature for 2 hr. After adding ethyl acetate to the liquid reaction mixture, the organic layer was washed with brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (developing solvent: 10 % ethyl acetate/n-hexane) to give 2-acetoxymethyl-4,7-difluorobenzofuran (252 mg) as a colorless oil.

<sup>1</sup>H-NMR(CDCl<sub>3</sub>,400MHz) δ : 2.14(s,3H), 5.20(s,2H), 6.84(dt,1H,J=3.2,8.8Hz), 6.89(d,1H,J=2.4Hz), 6.98(ddd,1H,J=4.0,8.8Hz)

[0120] The 2-acetoxymethyl-4,7-difluorobenzofuran (252 mg) was dissolved in methanol (5 ml). After adding potassium carbonate (455 mg) at room temperature, the resulting mixture was stirred at the same temperature for 2 hr. Then ethyl acetate was added to the liquid reaction mixture and the organic layer was washed with brine, dried over anhy-

drous magnesium sulfate and concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (developing solvent: 5 % ethyl acetate/n-hexane) to give 4,7-difluoro-2-hydroxybenzofuran (161 mg) as a colorless oil.

[0121] Oxalyl chloride (0.26 ml) was added at - 78 °C to dimethyl sulfoxide (0.42ml) and dichloromethane (7 ml) and the resultant mixture was stirred at the same temperature for 3 min. [0246] Methyl 4-[2-[5-(4,7-dimethylbenzofuran-2-yl)pyrrolyl]benzoate (0.20 g) was dissolved in dry tetrahydrofuran (5 ml). After adding N-fluoro-3,5-dichloropyridinium triflate (0.20 g), the resultant mixture was stirred at room temperature for 30 min. Then the liquid reaction mixture was poured into a cold saturated aqueous solution of sodium bicarbonate. After adding ethyl acetate (50 ml), the organic layer was washed with brine and dried over anhydrous magnesium sulfate. After filtering off the desiccant, the filtrate was concentrated. The resulting crude product was purified by silica gel column chromatography to give the title compound (0.05 g) as pale yellow crystals.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP97/03529

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: 1 - 7  
because they relate to subject matter not required to be searched by this Authority, namely:  
**The inventions of Claims 1 to 7 pertain to methods for treatment of the human or animal body by therapy.**
2.  Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest     The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.
